This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claim 1 (currently amended): A chimeric protein for detecting the presence or activity of a pre-determined protease, which comprises:

a) a cellular receptor repressor domain which represses activity of a normally biologically active protein fused thereto;

b) a reporter domain comprising a protein having a detectable biological activity when not fused to the repressor domain, wherein said reporter domain comprises  $\beta$ -glucuronidase;  
and

c) a protease cleavage domain linking the repressor domain to the reporter domain, the protease cleavage domain comprising a structure that is cleaved by activity of the pre-determined protease.

Claim 2 (currently amended): The chimeric protein of claim 1, wherein the cellular receptor repressor domain comprises a hormone binding domain of a steroid hormone receptor.

Claim 3 (canceled).

Claim 4 (original): The chimeric protein of claim 1, wherein the protease cleavage domain comprises a cleavage site for a caspase.

Attorney Docket No.: **RU-0170**  
Inventors: **Lam and del Pozo**  
Serial No.: **10/009,472**  
Filing Date: **March 29, 2002**  
Page 7

Claim 5 (original): The chimeric protein of claim 1, which further comprises a spacer between the protease cleavage domain and one or both of the repressor domain and the reporter domain.

Claim 6 (original): The chimeric protein of claim 1, which comprises at least one repressor domain and a plurality of reporter domains, each linked to the at least one repressor domain by a protease cleavage site.

Claim 7 (currently amended): The chimeric protein of ~~claim 7~~ claim 6, wherein the plurality of reporter domains are different from one another.

Claim 8 (currently amended): The chimeric protein of ~~claim 7~~ claim 6, wherein the protease cleavage sites are different from one another.

Claim 9 (original): A chimeric protein for measuring caspase activity, comprising a hormone binding domain linked to a  $\beta$ -glucuronidase enzyme by a peptide comprising a caspase cleavage site, wherein the  $\beta$ -glucuronidase is inactive due to linkage to the hormone binding domain and release of the  $\beta$ -glucuronidase through caspase cleavage of the cleavage site restores activity of the  $\beta$ -glucuronidase.

Claims 10-20 (canceled).
